I. Introduction

Woodchuck is the main outer project. But there are several full complete separate projects within woodchuck.

II. woodchuck

A project with a Vue3 front end, a gateway, and a backend for handling metadata in JPA and photographs in a repository.

III. backend

What is the set of microservices needed for woodchuck?

IV. crud_scaffold

Spring Initializr created. Used for understanding Spring relative to JPA.

V. docker_dependencies

Keycloak and postgres – docker images.

Opensearch and opensearch dashboard docker images

VI. gateway_reactive

Want to learn the differences between reactive and servlet (mvc).

VII. gateway_servlet

Want to learn the differences between reactive and servlet (mvc).

VIII. gaZap

A project for studying dataflows (Temporal), document processing (Docling), embeddings (ollama), and vector stores (postgres/pgvector, opensearch, neo4j)

IX. kT (knowledgeTransfer)

A study of Spring AI, MCP, how to task LLMs

X. LIM

A study of how tonenable human memory recall using AI to maintain a personal model. Lessons learned in gaZap and kT should be applicable to this project.

XI. ui

The front end to woodchuck.

A follow on piece. Woodhawk, is about payment added to the woodchuck project.

XII. woodchuck_mvc

Study of differences in RestControllers running in mvc server (blocking, threaded) versus reactive (non-blocking).

XIII. woodchuck_reactive

Study of differences in RestControllers running in mvc server (blocking, threaded) versus reactive (non-blocking).
